

## ABSTRACT

An outdoor apparatus includes a box-shaped main casing body that has an opening formed at a front face and that houses at least one electronic circuit board in an interior 5 thereof; and a box-shaped front panel that covers the front opening of the main casing body; an upper plate of the main casing body having a front face that is protruded upward and has a plate-like rearward protrusion that protrudes rearward from the upward protrusion; and the front panel 10 having a bent portion that is bent substantially perpendicularly from a front panel upper plate that opposes the upward protrusion of the main casing body and contacts a tip of the rearward protrusion of the main casing body. The reliability of the waterproof function against the 15 entry of rainwater is thereby improved.
